                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polynucleotide sequence of the pt127_1 clone
The PNS and proteins of the invention are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, hematopoiesis regulating activity, tissue growth activity, hemostatic activity, activity, hemostatic activity, activity, hemostatic activity, activity, and tumor and thrombolytic activity, receptor/ligand activity, and tumor inhibition activity. The PNS are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection or

This sequence was isolated from HSV-2 strain SB5 (deposited as ATCC VR-2546), is designated Contig ID 100, and encodes 6 HSV-2 proteins. The proteins can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antivirals. Antagonists of the proteins can be used to inhibit a viral polypeptide. The DNA sequence or a vector containing it can also be used to induce an immunological

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Q87587-89 encode polypeptides having a whole or partial epitope of structural protein of Leucocytozoan protozoa (see R70491-93). The polypeptides and DNA encoding them are useful in the production of vaccines for the treatment of leucocytozoanosis of fowl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 1686 BP; 915 A; 129 C; 382 G; 260 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence encodes human rhodopsin, and is shown without introns. The full sequence, with introns, is shown in T17116. Substitution of histidine for the normal nonpolar amino acid proline at position 23, by substitution of C with A in codon-23, results in a dysfunctional or absent molecule, affecting rod function, and is linked with autosomal dominant retinitis playmentosa. Probes T17117 and T17119 bind to the C-to-A compared transversion mutation sequence, and probes T17118 and T17120 bind transversion mutation sequence. Primers 485 (T17122) and 502 to the corresponding normal sequence. Primers 485 (T17122) and 502 to the corresponding normal sequence. Primers 485 (T17121) to amplify mutant and normal sequences, respectively, by PCR. Mutations in the retinal degeneration slow protein and retinal rod coWP-phosphodiestorase genes are also implicated in retinitis planentosa. Detection of any of these mutations in a foetus or pagmentosa. Detection of any of these mutations in a foetus or

                                                                                                                                                                                                                                                                                                                                                                                                         staphylococcus aureus UT0007. The sequence of the BacRI operon of was determined by N-terminal sequencing of purified BacRI operon (see W54171), with back-translation and plasmid analysis. The BacRI operon includes the BacRI gene (see V21510), a homologue of the CylM gene of the cytolysin operon of Enterococcus faecalis whose function is involved in the maturation of pre-cytolysin, and ATP-transporter gene, biol and bio2 genes related to lactococcin biosynthesis and modification, and a gene involved in immunity function. BacRI peptides can be produced by construction of an expression vector containing an oligonucleotide or operon coding for BacRI, and use of the vector to transform host cells for BacRI expression. The entire BacRI operon has been cloned into coding for BacRI, and use of the vector has been cloned into the medium. BacRI is estive against many Gram-positive and Gram-negative organisms such as Bordetella bronchoseptica, Pasteurella multocida and call showing the substitution of the serioconfunctivitis, is especially sensitive. BacRI can also be used as an anti-cancer agent:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       c cDNA clones (T69546-50) respectively code for rat pheromone receptors VN3, VN4, VN5, VN6 and VN7 (WJ9104-08), members of a covel family of presumed 7-transmembrane domain receptors that are covolutionary independent of the odorant receptors of the main colfactory epithelium. These clones, and a clone for VN2 (sequence not provided), were isolated from rat vomeronasal organ cDNA (libraries by PCR and hybridisation. A differential cloning method was used to isolate vN7 cDNA (T69545). VN1-VN7 (not VN2) clones have been deposited in pBluescript as ATCC 97294-97299. A human homologue, HG25 (T69551), has also been isolated. VN polypeptides can be expressed in host-vector systems for use in identifying modulators for control of maternal, reproductive and social behaviour, to increase fertility, control hormone secretion and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ratio:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This isolated polynucleotide codes for HNFDY20 (see W59924), a covel human 7-transmembrane G-protein coupled receptor. HNFDY20 CC novel human 7-transmembrane from cDNA libraries derived from CC mRNA in cells of human testis and human liver using expressed CC sequence tag analysis. The invention relates to HNFDY20 CC polypeptides and recombinant materials and methods for their CC production. It also provides methods for using such polypeptides CC and HNFDY20 polynucleotides for treatment of infections such as acceptable, indeed a provides methods for using such polypeptides CC infections, and conditions including pain, cancers, anorexia, bypertension, unitary retention, osteoporosis, angina pectoris, CC myocardial infarction, ulcers, allergies, benign prostatic hypertrophy, and psychotic and neurological disorders, including CC mxiety, schizophrenia, manic depression, delirium, dementia, severe mental retardation and dyskinesias, such as Huntingdon's CC disease or Gilles de la Tourette's syndrome. Gene therapy using CC under-expression of the protein. The invention also relates to CC methods of identifying agonists and antagonists and for using CC unch compounds to treat conditions associated with HNFDY20 can be used to treat with HNFDY20 contended. CC with inappropriate HNFDY20 activity or levels are also provided.
                                                                                                                                                                                                                                               Align seg 1/1 to: V53631
